STRATEGIC ASSESSMENT: OPERATION ABSOLUTE RESOLVE AND THE RESTRUCTURING OF THE GLOBAL ENERGY ORDER

| Global Energy & Geopolitical Practice January 2026

Executive Summary

The military intervention in Venezuela on January 3, 2026, codenamed Operation Absolute Resolve, represents a fundamental shift in the global security architecture and a definitive move toward a new era of "Resource Realism". While the official justification centers on narco-terrorism indictments and the restoration of democratic legitimacy, the underlying drivers are rooted in systemic fragility within the United States' financial and energy infrastructure. This intervention serves as a strategic "margin call" on the U.S. standing in the global economy, triggered by record-low Strategic Petroleum Reserve (SPR) levels, a weakening dollar, and an imminent threat to the petrodollar system.

Tactically, the operation demonstrated unprecedented kinetic precision, utilizing over 150 aircraft to suppress air defenses and extract President Nicolás Maduro in under three hours with zero U.S. fatalities. However, the strategic endgame remains complex. The U.S. administration has declared its intent to "run" Venezuela until a transition occurs, prioritizing the revitalization of the Orinoco Belt’s 303 billion barrels of oil—the world's largest proven reserves.

Successful reconstruction of the Venezuelan energy sector will require an estimated $100 billion to $110 billion in investment over a decade to return production to its 3.5 million barrels per day (bpd) peak. In the interim, the U.S. has established an "oil quarantine," interdicting tankers to redirect heavy crude to Gulf Coast (PADD 3)

refineries that are currently facing a critical supply deficit. This report analyzes the military execution, macroeconomic imperatives, energy sector requirements, and geopolitical risks associated with this paradigm-shifting intervention.

Section I: The Kinetic Catalyst – Tactical Execution of Operation Absolute Resolve

1.1 Mission Profile and Force Composition

Operation Absolute Resolve was executed on January 3, 2026, commencing at approximately 02:00 local time. The raid was defined by total technological dominance and brevity, contrasting with historical efforts at leadership decapitation. The primary execution force consisted of the 160th Special Operations Aviation Regiment (SOAR) and Delta Force, supported by the FBI's Hostage Rescue Team (HRT) to reinforce the narrative of a law-enforcement action.

The aerial fleet involved 150 aircraft, including F-22A Raptors, F-35A/C Lightning IIs, and B-1B Lancer bombers, launched from 20 different land and sea bases. The operation focused on the total suppression of 53 long- and medium-range air defense systems and over 440 anti-aircraft cannons. Within 30 minutes of landing in Caracas, Maduro and his wife, Cilia Flores, were captured at their compound and extracted to the USS *Iwo Jima*.

1.2 Strategic Surprise and Impact

The U.S. military achieved total surprise, effectively paralyzing the 93,000-strong Venezuelan ground forces. While preliminary reports indicate that at least 80 people were killed—including 32 Cuban military and security personnel—the U.S. reported only two non-life-threatening injuries. Critically, initial assessments suggest that Venezuela's primary oil production and refining infrastructure were spared from physical damage, facilitating the planned "reconstruction mode".

Section II: Macroeconomic Imperatives – The Financial "Margin Call"

2.1 The Crisis of the Petrodollar The timing of the intervention was dictated by a "red line" in global finance. In late 2025, reports circulated that the Maduro administration was preparing to price its oil exclusively in a basket of BRICS currencies, a move that would have signaled the "yuanization" of energy markets in the Western Hemisphere. Since 1971, the petrodollar system has guaranteed artificial demand for U.S. currency; a disconnection of the world's largest oil tank from the dollar would likely cause U.S. Treasury bond demand to collapse and interest rates to skyrocket.

2.2 Fiscal Instability and Record Leverage Domestic fiscal policy in 2025 exacerbated this vulnerability. The "One Big Beautiful Bill" (OBBBA) added an estimated $3.4 trillion to $4.1 trillion to the national deficit over ten years. By late 2025, the U.S. Dollar Index (DXY) had fallen nearly 10%, its weakest year in a decade.

Simultaneously, U.S. financial infrastructure faced a leverage crisis, with nominal margin debt reaching $1.21 trillion by November 2025. The intervention in Venezuela provided a "risk-on" catalyst to pivot market sentiment away from a looming margin-driven cascade and toward a future of massive energy sector reconstruction.

2.3 Depletion of the Strategic Petroleum Reserve (SPR) For the three years preceding the raid, the U.S. government systematically drained the SPR to artificially lower domestic gas prices, bringing reserves to their lowest levels since the 1980s. With the SPR depleted, the U.S. lacked the "family silver" to pay the rent on its energy security, necessitating the seizure of Venezuelan oil as collateral.

Section III: Energy Sector Analysis – Dependency and Potential

3.1 Structural Mismatch in U.S. Refining (PADD 3) The "shale revolution" produced a surplus of light, sweet crude, yet the complex refineries along the U.S. Gulf Coast (PADD 3) were engineered specifically for heavy, sour grades. Venezuelan crude, particularly from the Orinoco Belt, is "extra-heavy" (5-15° API) and highly viscous, resembling semi-solid tar.

By late 2025, PADD 3 refineries were operating at 97.8% utilization but faced a critical supply gap due to:

- Mexican Export Declines: A reduction of 400,000 bpd of Maya blend to feed domestic Mexican refineries.
- Tariff Pressures: A 25% tariff on Mexican goods and 10% on Canadian energy implemented in early 2025.
- Canadian Diversion: Increased TMX pipeline capacity redirected Canadian heavy crude to Asian markets.

3.2 The Oil Quarantine and Supply Chain Near-Shoring Under Executive Order 14157, the U.S. Navy has implemented an "oil quarantine" to interdict tankers destined for China or India. This policy effectively forces a "near-shoring" of the energy supply chain, redirecting discounted Venezuelan barrels to Gulf Coast refiners such as Valero, Marathon, and Phillips 66. Valero, the largest U.S. importer of Venezuelan crude prior to the conflict, saw its stock price jump 8% as markets anticipated expanded refining margins.

Section IV: The Reconstruction Challenge – A "Marshall Plan" for Oil

4.1 Infrastructure Decay and Investment Requirements Decades of mismanagement and underinvestment under the Chávez and Maduro regimes have left the Venezuelan oil industry in a "shambles". Production fell from 3.5 million bpd in 1997 to approximately 900,000 bpd by late 2025. Restoring the industry to its historic peak will

require a massive infusion of capital and technology, estimated at over $100 billion over 10+ years.

Table 1: Projected Restoration Phases and Costs

Restoration Phase	Estimated Cost (USD)	Timeline	Target Production (bpd)
Immediate Stabilization	$10 - $15 Billion	1 - 2 Years	1.1 - 1.5 Million
Infrastructure Overhaul	$40 - $60 Billion	3 - 5 Years	2.0 - 2.5 Million
Full Capacity Recovery	$100 - $110 Billion	10+ Years	4.0 Million

(Sources:)

4.2 Corporate Frontrunners and Business Model Shifts The "PDVSA model" of state-run inefficiency is expected to be replaced by Public-Private Partnerships and production-sharing contracts.

- Chevron: Positioned for early recovery due to its existing joint ventures and continuous presence in-country.
- Oilfield Services: SLB (Schlumberger) and Halliburton are critical for workovers, artificial lift, and rebuilding pipelines; both saw stock gains of 11% following the raid.
- Expropriation Claims: ExxonMobil and ConocoPhillips hold $20 billion to $30 billion in outstanding arbitration claims, which may

be settled through "debt-for-equity" swaps for field operating leases.

4.3 Technical Hurdles: Diluents and Power The extra-heavy Orinoco crude requires dilution with lighter oils or chemical "upgrading" to be transportable via pipeline. Most of the country's upgraders at the Jose industrial complex are in disrepair and require significant localized power generation to ensure uptime. Recovery is not a "quick restart" but a multi-year repair cycle.

Section V: Geopolitical & Legal Scenarios – Monroe Doctrine 2.0

5.1 The "Donroe Doctrine" and Regional Precedent President Trump has characterized the action as an application of the Monroe Doctrine, styled as the "Donroe Doctrine," asserting that American dominance in the Western Hemisphere will never be questioned again. By removing a key ally of Tehran, Moscow, and Beijing, the U.S. has eliminated a strategic bridgehead that hosted military cooperation with rival powers. This signals to other regimes in the Caribbean basin that they now face "Panama-style" decapitation risk rather than just sanctions.

5.2 Eurasian Counter-Alignment and Scenarios The intervention has created a profound sense of insecurity among Eurasian powers.

- Russia: May view the capture as a breach of limits on political leaders' security, potentially justifying decapitation strikes against the Ukrainian leadership.
- China: Faces a significant supply shock, as 80-85% of Venezuelan exports previously flowed to Beijing. China is likely to "double down" on energy partnerships with Russia and Iran, reinforcing the "Eurasian Energy Triangle".

- **Taiwan: Beijing may interpret the operation as a demonstration of U.S. resolve or a "test run" for interventions in the Indo-Pacific, potentially accelerating plans for a preemptive strike.**

5.3 Legal Contradictions and Domestic Authority The administration justified the operation under "inherent constitutional authority" (Article II) as a law-enforcement action to arrest indicted fugitives. However, international law experts and UN officials argue the raid violated Article 2(4) of the UN Charter regarding sovereign equality and the prohibition of force. Domestically, the lack of Congressional notification under the War Powers Resolution remains a point of contention, though the administration argues notification would have endangered the mission.

Section VI: Risk Assessment & Strategy Recommendations

6.1 Systemic Risks: The Missing Endgame While the raid was a tactical success, it left 99.9% of the original Chavista regime intact. Acting President Delcy Rodríguez has denounced the capture as a "Zionist" kidnapping and vowed to resist foreign troops. There is a significant risk that Maduro loyalists will engage in "anarchization" tactics—sabotage and guerrilla warfare—to make the country ungovernable.

6.2 The "Savior" Paradox The U.S. administration has bypassed the democratic opposition leader, María Corina Machado, claiming she lacks "respect" in the country. By attempting to "run" the country through existing Maduro-era technocrats like Rodríguez, the U.S. risks legitimizing the very institutions it sought to dismantle.

6.3 Strategy Recommendations for Private Sector Stakeholders

1. **Capital Discipline: Investors should monitor the "Rubio Task Force" for the establishment of legal frameworks and contract enforceability before committing major greenfield capital.**
2. **Security Integration: Oil companies operating in the Orinoco Belt must prepare to fund their own sustained security presence to protect infrastructure from sabotage.**
3. **Hedge Strategies: Gold has reasserted its role as a primary geopolitical hedge following the raid; crude futures may remain volatile as the market balances a near-term "fear premium" against a long-term supply glut from restored Venezuelan output.**

Conclusion

The Venezuela intervention marks the end of the post-Cold War diplomatic era and the birth of "Resource Realism". The U.S. has answered its financial and energy margin call with kinetic force, securing the world's largest oil reserves as collateral for the dollar.

Analogy for Stakeholders: The United States has acted like a homeowner who has lived for years on a high-limit credit card, backed only by his control of the town’s main water valve. When his neighbors began building a new well and his credit limit was finally reached, he didn't negotiate; he used a shotgun to take over the largest well in the county. He has the water now, and his credit line is temporarily restored, but he has proven to the entire neighborhood that he is broke and dangerous. The neighbors will now work twice as hard to ensure they never have to rely on his valve again. The "exorbitant privilege" of the dollar remains for now, but it is increasingly held together by steel rather than trust.
